

BALHE-0009SMG

HIGH POWER SURFACE MOUNT BROADBAND BALUN

DEVICE OVERVIEW

General Description

The BALHE-0009SMG is a surface-mount broadband balun, hand-tuned for optimal phase and amplitude balance over 10 MHz to 9 GHz bandwidth. Designed for high volume production with cost optimization in mind, it serves as an excellent choice for analog to digital converters, balanced receivers, baseband digital modulations, and signal integrity enhancement. If lower frequency operation is required, the BALH-0009SMG offers performance down to 500 kHz in the same package.

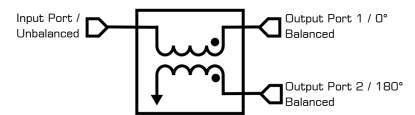

Features

- 10MHz to 9GHz 1:1 Balun (Balanced to Unbalanced Transformer)
- Transforms 50 Ω single ended to 50 Ω differential/25 Ω single ended
- Tuned for Optimal Phase/Amplitude Balance

Applications

- Analog to Digital Converters
- Balanced Receivers
- Baseband Digital Modulation
- Signal Integrity

Port Diagram

A top-down view of the BALHE-0009SMG package outline drawing is shown below. Marki baluns are passive reciprocal devices allowing either single ended to differential or differential to single ended conversion.

Port Functions

Port	Function	Description	DC Equivalent Circuit
Common Port / In (Unbalanced)	RF Input	The common port is DC short to ground.	
Out 1 / 0° Port (Balanced)	0° Port	The 0° port is DC short to ground.	
Out 2 / 180° Port	180° Port	The 180° port is DC short to ground

Typical Mixed Mode Performance Plots

Mixed mode scattering parameters are used to characterize differential circuits. For baluns, this means that the 0° and 180° ports become a single 100Ω differential port and the common port remains the same 50Ω common port. The two-port s-parameters of the balun are then characterized based on differential (d), common mode (c), or single-ended (s) signals. Sds21 is the differential output response given a single ended input.

Typical Performance Plots

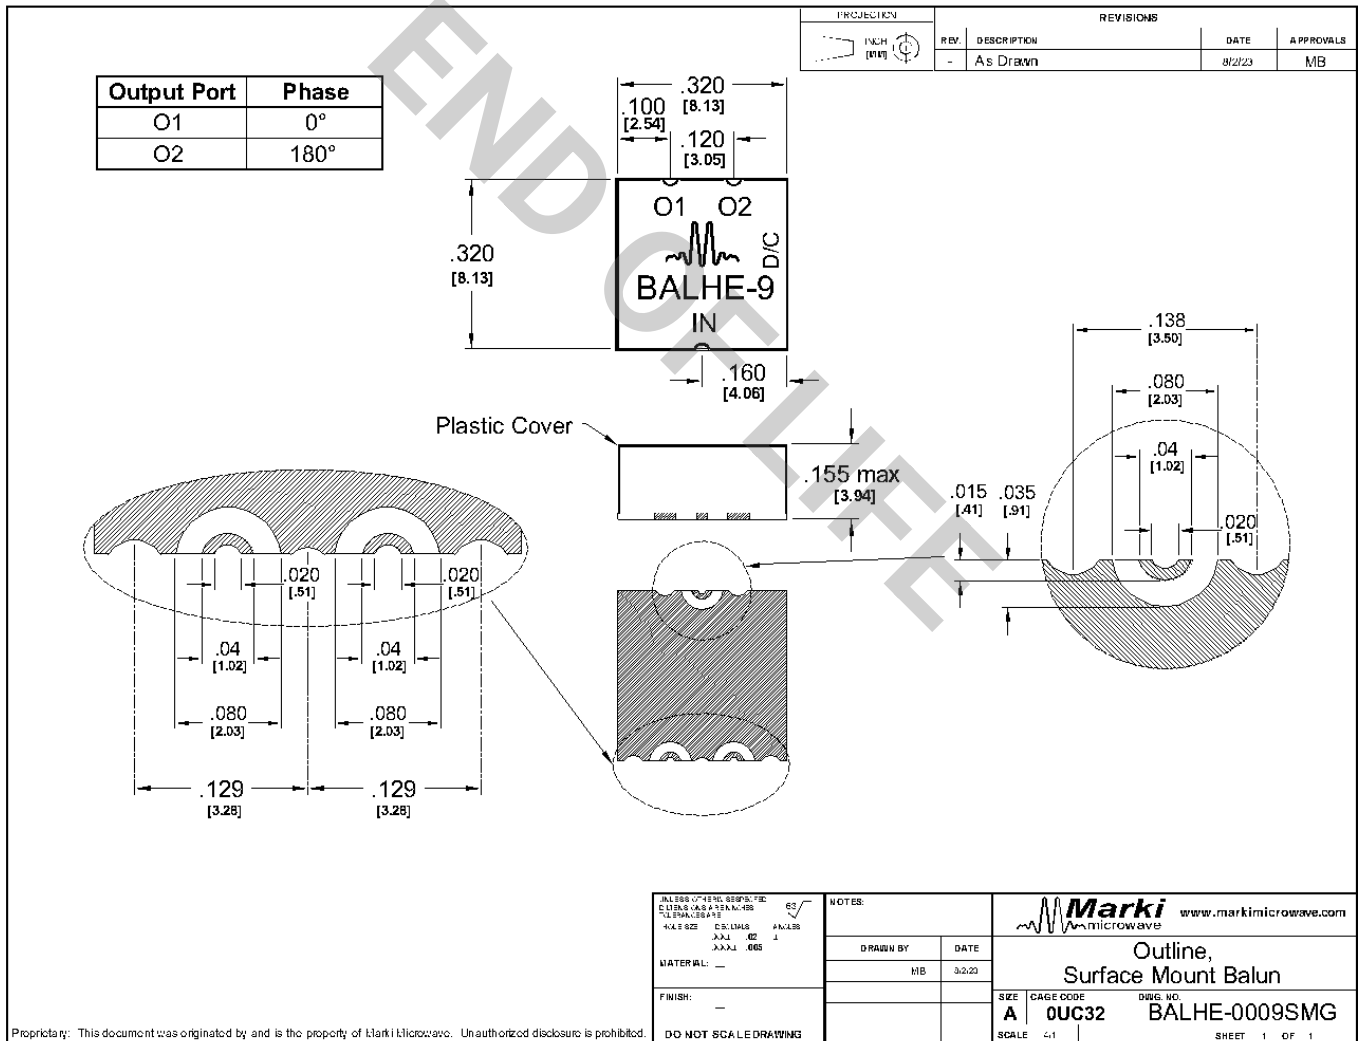

Three port scattering parameters measured as three single-ended 50Ω ports showing relationship between any two ports.
