

MM1-0424SCH-2

GaAs Double-Balanced Mixer

DEVICE OVERVIEW

General Description

The MM1-0424S is a high linearity passive double balanced MMIC mixer. The S diode offers superior 1 dB compression, two tone intermodulation performance, and spurious suppression to other GaAs MMIC mixers. It features excellent conversion loss, superior isolations and spurious performance across a broad bandwidth, in a miniature form factor. The MM1-0424S is available as a wire bondable chip or an SMA connectorized package. The MM1-0424S is a superior alternative to Marki Microwave carrier and packaged M1 and M3 mixers

Features

- Compact Chip Style Package (0.058" x 0.046"x0.004"
- CAD Optimized for Superior Isolation and Spurious Respons
- Broadband Performance
- Excellent Unit-to-Unit Repeatability
- Fully nonlinear software models available with Marki PDK for Microwave Office
- RoHS Compliant

Applications

N/A

Port Configuration and Functions

Port Diagram

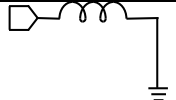

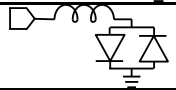

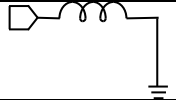

Port Functions

Configuration A

Port	Function	Description	Equivalent Circuit for Package
Port 1	LO	Port 1 is DC short to ground and AC matched to 50 Ohms from 4.5 to 24 GHz. Blocking capacitor is optional.	
Port 2	IF	Port 2 is DC coupled to the diodes. Blocking capacitor is optional.	
Port 3	RF	Port 3 is DC short to ground and AC matched to 50 Ohms from 4.5 to 24 GHz. Blocking capacitor is optional.	

Configuration B

Port	Function	Description	Equivalent Circuit for Package
Port 1	RF	Port 1 is DC short to ground and AC matched to 50 Ohms from 4.5 to 24 GHz. Blocking capacitor is optional.	
Port 2	IF	Port 2 is DC coupled to the diodes. Blocking capacitor is optional.	
Port 3	LO	Port 3 is DC short to ground and AC matched to 50 Ohms from 4.5 to 24 GHz. Blocking capacitor is optional.	

Specifications

Absolute Maximum Ratings

Parameter	Maximum Rating	Unit
Maximum Operating Temperature	100	°C
Maximum Storage Temperature	125	°C
Minimum Operating Temperature	-55	°C
Minimum Storage Temperature	-65	°C
Port 1 DC Current	15	mA
Port 2 DC Current	30	mA
Port 3 DC Current	15	mA
RF Power Handling (RF+LO), 100°C	24	dBm
RF Power Handling (RF+LO), 25°C	28	dBm

LO Input Power	17	-	23	-

Electrical Specifications

Specifications guaranteed from -55 to +100°C, measured in a 50Ω system. All bare die are 100% DC tested and 100% visual inspected. RF testing is performed on a sample basis to verify conformance to datasheet guaranteed specifications. Consult factory for more information.

Parameter	Port Configuration	Test Conditions	Min	Typ	Max	Unit
Conversion Loss	A	LO/RF=4.5-24 GHz IF=DC-4 GHz	-	8	13	dB
Input 1 dB Compression	A	LO/RF=4.5-24 GHz IF=DC-4 GHz LO Drive Level=18-23dBm	-	14	-	dBm
Input IP3	A	LO/RF=4.5-24 GHz IF=DC-4 GHz LO Drive Level=18-23dBm	-	25	-	dBm
Isolation, LO to RF	A	-	-	49	-	dB
Conversion Loss	B	LO/RF=4.5-24 GHz IF=DC-4 GHz LO Drive Level=18-23dBm	-	9	16	dB
Input 1 dB Compression	B	LO/RF=4.5-24 GHz IF=DC-4 GHz LO Drive Level=17-23dBm	-	14	-	dBm
Input IP3	B	LO/RF=4.5-24 GHz IF=DC-4 GHz LO Drive Level=17-23dBm	-	23	-	dBm
IF Frequency Range	-	-	0	-	4	GHz
LO Frequency Range	-	-	4.5	-	24	GHz
RF Frequency Range	-	-	4.5	-	24	GHz

Typical Performance

MM1-0424SS - Typical Performance Plots

Performance plots for the connectorized module are shown for measurements where directly probed measurements of the die are unavailable. Note that the following measurements include losses from connectors and microstrip traces.

Spur Table

Downconversion Spurious Suppression

Spurious data is taken by selecting RF and LO frequencies (+mLO+nRF) within the RF/LO bands, to create a spurious output within the IF output band. The mixer is swept across the full spurious band and the mean is calculated. The numbers shown in the table below are for a -10 dBm RF input. Spurious suppression is scaled for different RF power levels by (n-1), where “n” is the RF spur order. For example, the 2RFx2LO spur is 69 dBc for the A configuration for a -10 dBm input, so a -20 dBm RF input creates a spur that is (2-1) x (-10 dB) dB lower, or 79 dBc.

Typical Downconversion Spurious Suppression (dBc): A Configuration (B Configuration)⁴

-10 dBm RF Input	0xLO	1xLO	2xLO	3xLO	4xLO	5xLO
1xRF	24 (18)	Reference	18 (31)	13 (13)	30 (39)	20 (28)
2xRF	68 (67)	62 (52)	69 (67)	67 (53)	72 (70)	70 (54)
3xRF	90 (94)	77 (72)	87 (94)	84 (81)	87 (91)	81 (85)
4xRF	120 (120)	118 (110)	119 (116)	119 (115)	119 (120)	117 (117)
5xRF	130 (128)	133 (122)	131 (130)	130 (129)	129 (134)	129 (128)

Unless otherwise specified, data is taken with +20 dBm LO drive.

Upconversion Spurious Suppression

Spurious data is taken by mixing an input within the IF band, with LO frequencies (+mLO+nIF), to create a spurious output within the RF output band. The mixer is swept across the full spurious output band and the mean is calculated. The numbers shown in the table below are for a -10 dBm IF input. Spurious suppression is scaled for different IF input power levels by (n-1), where “n” is the IF spur order. For example, the 2IFx1LO spur is typically 70 dBc for the A configuration for a -10 dBm input, so a -20 dBm IF input creates a spur that is (2-1) x (-10 dB) dB lower, or 80 dBc.

Typical Upconversion Spurious Suppression (dBc): A Configuration (B Configuration)⁴

-10 dBm IF Input	0xLO	1xLO	2xLO	3xLO	4xLO	5xLO
1xIF	22 (20)	Reference	21 (35)	13 (12)	29 (39)	25 (32)
2xIF	60 (49)	70 (70)	61 (53)	68 (73)	58 (50)	68 (63)
3xIF	84 (88)	76 (80)	84 (90)	74 (74)	80 (87)	66 (72)
4xIF	131 (119)	117 (118)	116 (107)	116 (116)	107 (96)	115 (103)
5xIF	145 (144)	130 (129)	131 (128)	124 (125)	126 (129)	106 (114)

Unless otherwise specified, data is taken with +20 dBm LO drive.

Die Mounting Recommendations

Mounting and Bonding Recommendations

Marki MMICs should be attached directly to a ground plane with conductive epoxy. The ground plane electrical impedance should be as low as practically possible and the epoxy should have high thermal conductivity. This will prevent resonances and permit the best possible electrical performance. Datasheet performance is only guaranteed in an environment with a low electrical impedance ground. MMICs with high power dissipation, particularly those with high DC power requirements, also require a thermally conductive ground plane with a thermally conductive epoxy attachment.

Mounting - To epoxy the chip, apply a minimum amount of conductive epoxy to the mounting surface so that a thin epoxy fillet is observed around the perimeter of the chip. Cure epoxy according to manufacturer instructions.

Wire Bonding - Ball or wedge bond with 0.025 mm (1 mil) diameter pure gold wire. Thermosonic wirebonding with a nominal stage temperature of 150 °C and a ball bonding force of 40 to 50 grams or wedge bonding force of 18 to 22 grams is recommended. Use the minimum level of ultrasonic energy to achieve reliable wirebonds. Wirebonds should be started on the chip and terminated on the package or substrate. All bonds should be as short as possible <0.31 mm (12 mils).

Circuit Considerations – 50 ohm transmission lines should be used for all high frequency connections in and out of the chip. Wirebonds should be kept as short as possible, with multiple wirebonds recommended for higher frequency connections to reduce parasitic inductance. In circumstances where the chip more than .001" thinner than the substrate, a heat spreading spacer tab is optional to further reduce bondwire length and parasitic inductance.

Handling Precautions

General Handling: Chips should be handled with a vacuum collet when possible, or with sharp tweezers using well trained personnel. The surface of the chip is fragile and should not be contacted if possible.

Static Sensitivity: GaAs MMIC devices are subject to static discharge, and should be handled, assembled, tested, and transported only in static protected environments.

Cleaning and Storage: Do not attempt to clean the chip with a liquid cleaning system or expose the bare chips to liquid. Once the ESD sensitive bags the chips are stored in are opened, chips should be stored in a dry nitrogen atmosphere.

Notes

1. Mixer Conversion Loss Plot IF frequency is 100 MHz.
2. Mixer Noise Figure typically measures within 0.5 dB of conversion loss for IF frequencies greater than 5 MHz.
3. Conversion Loss typically degrades less than 0.5 dB at +100°C and improves less than 0.5 dB at -55°C.
4. Unless otherwise specified, data is taken with +20 dBm LO drive.
5. Specifications are subject to change without notice. Contact Marki Microwave for the most recent specifications and data sheets.
6. Catalog mixer circuits are continually improved. Configuration control requires custom mixer model numbers and specifications.
