BALH-0010

High Power Balun (200 kHz to 10 GHz)

DEVICE OVERVIEW

General Description

The BALH-0010 is a broadband balun, hand-tuned for optimal phase and amplitude balance over a 200 kHz to 10 GHz bandwidth. It serves as an excellent choice for analog to digital converters, balanced receivers, baseband digital modulations, and signal integrity enhancement.

Features

- 1:1 Impedance Ratio
- 200 kHz to 10 GHz Balun (Balanced to Unbalanced Transformer)
- Better than 37 dBm 1-dB compression point
- Tuned for Optimal Phase/Amplitude Balance

Applications

- Analog to Digital Converters
- Balanced Receivers
- Baseband Digital Modulation
- Signal Integrity

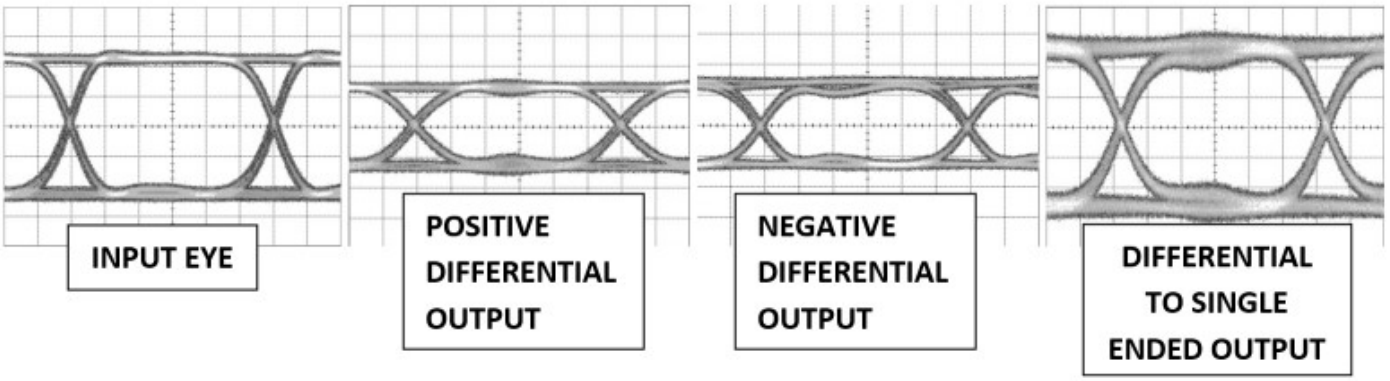
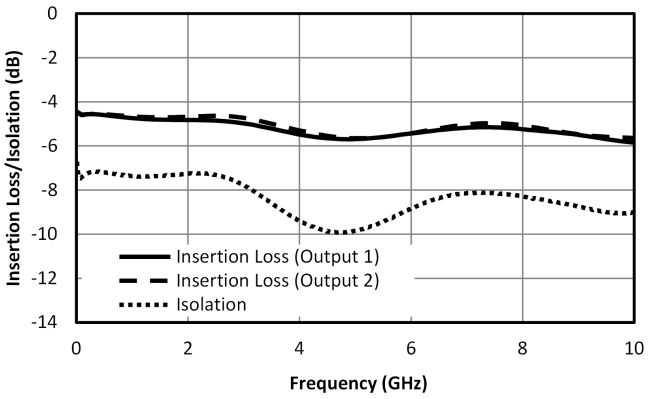
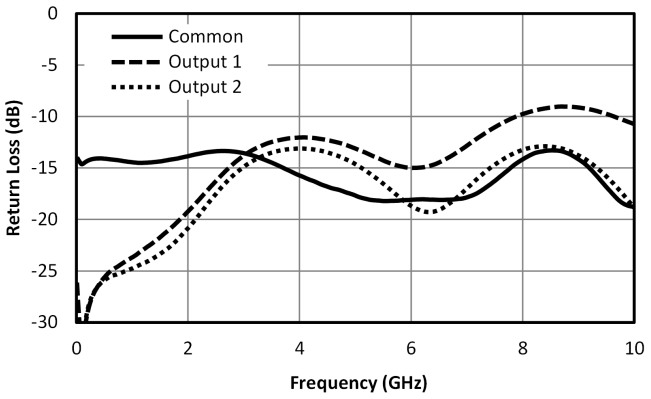
Time Domain Performance Plot

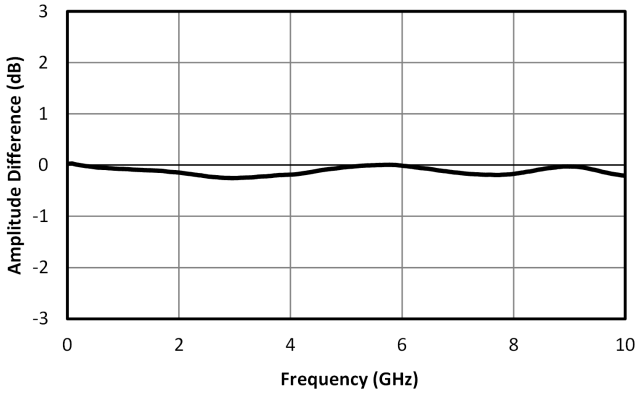


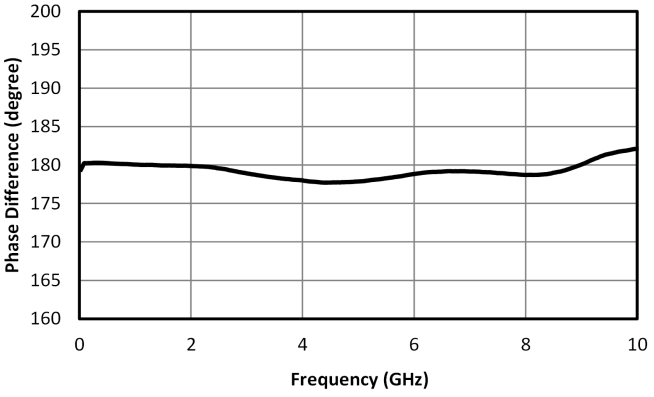
Typical Performance Scattering Parameters

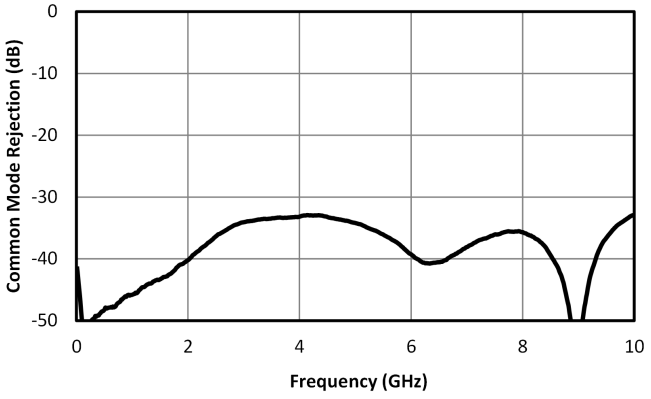
Three port scattering parameters measured as three single-ended 50Ω ports showing relationship between any two ports. For example: S21 and S31, often referred to as insertion loss of a balun, is the output response on ports 2 and 3 with an input stimulus on port 1.











Mixed Mode Scattering Parameters

Mixed mode scattering parameters are used to characterize differential circuits. For baluns, this means that the 0° and 180° ports become a single 100Ω differential port and the common port remains the same 50Ω common port. The two-port s-parameters of the balun are then characterized based on differential (d), common mode (c), or single-ended (s) signals. For example: S12ds is the differential output response given a single ended input.
